

Hierarchy Dividers for Unity3D

Dear user, welcome to the documentation of this tool – I hope you enjoy using it 😊

1. Setup

After importing the package, you can start right ahead.

A set of hierarchy dividers is stored in templates. So, let's create one:

Right-click in a project folder and got to *Create > Manaspark > Hierarchy Dividers > Template*. Now name it properly and head over to the configurator.

2. Configuring

Go to the top of Unity's window and select *Manaspark > Hierarchy Divider Config*.

In the configurator, select a template at the top on the 'Preset' field.

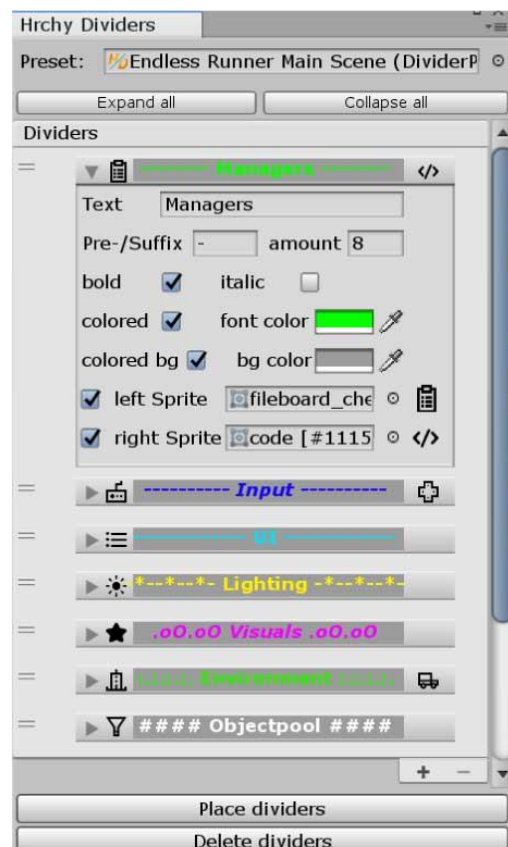

Add more dividers by clicking the '+' icon in the bottom right corner or delete a selected one with '-'.

To place the dividers in your hierarchy, just click on 'Place dividers'. If there are already dividers in the hierarchy, the configurator will try to replace dividers with matching names.

Once a divider is in your hierarchy, it's automatically set to 'Editor only', so that it won't appear in your actual build.

Gain even more control over the icons with the [PRO-Version](#).

3. Support
